

JT20: *The Polycentric Knee Joint.*

The JT20 Polycentric Knee Joint is a new development by Bauerfeind for transfemoral and knee disarticulation amputees of mobility level 2 and 3. It is the first product which allows simple changing from a safe to a dynamic geometry. This is made possible by two geometric curves which can be set individually by a simple adjustment of the excentric.

A physiological way of walking is ensured by the interaction of an extension assist and a pneumatic damper - the so called pre-extension stop.
