In the prosthetic industry today components are important, comfort is important, but **SUSPENSION IS CRUCIAL.**

Offering suspension where it was not available before.

The **Summit Lock** and the new **Lowpro Summit Lock** feature a design so advanced its' simple. Both locks are mounted proximally, require zero clearance, and are the first and only locks to truly control rotation.

The locks are durable, waterproof, and its ramped design prevent accidental unlocking regardless of patient weight or activity level.

Even before coding changes took place we were working to make our locks easier to fabricate, and more economical.

We succeeded.
