

ARE YOU STILL WORKING WITH A DUMMY ?

AIR-LOCK™

Coyote Design feels there are enough dummies out there. That is why we designed the Air-Lock to be fabricated without using dummies. The Air-Lock features a valve on the inside to keep unwanted air out of the socket. This way you can achieve an airtight suction socket in conjunction with a lock once you vacuum form or laminate. This allows for better comfort and suspension with increased safety and security.

The Air-Lock connectors have been improved to make our single lamination technique even easier. You are able to build the prosthetic alignment into the socket separate from the pin alignment in one lamination or vacuum form to reduce time, materials, and wear.
