

The technical and clinical vision behind the ORION has always been to create a microprocessor knee that is built to provide optimal movement, speed, control and security features for low to moderate K3 activity level users. We are always seeking to continually improve and enhance upon our technology to adapt our products to the needs of the amputee and that is exactly what we have done with the ORION.

fixed angle flexion lock

programming and fine tuning via ORION software

manual programming and fine tuning

While the ORION already offers users the stability and confidence to perform daily routines, we have added new features that will benefit them even more. From fixed angle flexion lock to an enhanced yield rate, the ORION has been re-adapted to not only fit the needs of everyday life, but open the user to more activities so they can *get busy living*

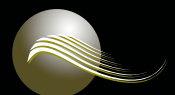

Stop by our booth at the 2014 Hanger Education Fair & AAOP Annual Meeting to see the ORION in action and learn more about the latest features & benefits!
