

Introducing a new Orthotic treatment for Blounts Disease and other pediatric lower limb deformities.

www.blountsdisease.net

The patented JMMR Blount's KAFO allows normal daytime activity while applying corrective forces to the patients limb.

The JMMR KAFO has a patented distal posterior swivel hinge that allows the molded tibial section to be pulled with an elastic force strap to provide the necessary dynamic forces to correct limb deformity. The corrective forces are applied distal to the knee center and this allows for normal ambulation and full knee and ankle joint mobility.

Correction can be anticipated in significantly less time than traditional approaches.

Available only through JMMR Central Fab with a 10-14 days turn around.

Compliance will no longer be a problem. Patient and parent friendly.

Call for pricing.
