

# Control ... It's More Than Suspension

I have more control of the leg; my leg feels more like a part of me—are nearly universal comments made by amputees when provided the Power Belt or Power Short Auxiliary Suspension Belt™. The unique material application makes this possible—dynamic high denier Lycra and nylon material hugs the prosthesis to the body like no other belt. Other benefits include more effective body integration, complete rotational control, elimination of lateral gaping, and better suction maintenance during sitting.

Improved proprioceptive control and body integration expands the range of patients who may benefit from using an auxiliary suspension belt for selected activities or daily use. Eliminates lack of confidence encountered with other belts.

**U.S. and international patents pending.**

Highly porous 1mm thin nylon Lycra material keeps patients cooler and minimizes bulk, yet is dynamically strong and durable.

**L5695 suggested for both products.**

The Power Short Auxiliary Suspension Belt™, with continuous waist configuration, completely eliminates the bulk and discomfort of velcro closures, and is preferred by some patients.
