

Take an **Ez stride** into the Orthotic Future!

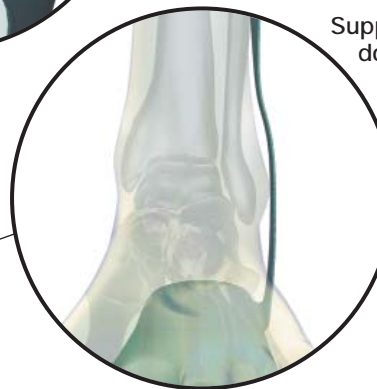

A super thin, lightweight ankle foot orthosis, made of a high strength, carbon fiber composite fabric that is formed under extreme pressure which produces a true, monolithic part that will not de-laminate or break down.

Thinner and lighter; the Easy stride only contacts the patient at the calf band and foot plate. The spiral design allows for an obscure look which increases patient comfort and confidence.

Super flexible calf band will conform to every patient size.

Support strut does not push shoe away and provides clearance at the lateral malleolus without contacting the patient.

Dynamic, floor-reaction foot plate stores and releases energy to assist the patient in achieving a more normal gait cycle.

The **Ez stride** will help restore your patient's normal biomechanical gait functions without sacrificing comfort or appearance. The composite technology of the future will bring comfort and relief to your patient today!
