

# Hip Tracker

**Coming Soon...**  
Fully adjustable  
abduction/adduction  
control

*A revolutionary new hip joint that accomplishes what the other's cannot... lock or "track" the orthosis on the pelvis as the patient moves into a sitting position. The "Hip Tracker" is the only hip joint available today that prevents migration of the pelvic band into the rib cage.*

**Hip Tracker shown mounted on Guardian Hip Orthosis**

Patent Pending.

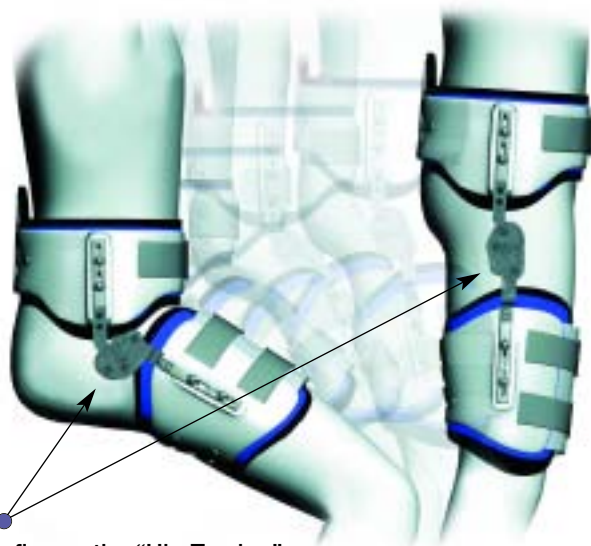

Patented, universal pelvic band has a lockable, anterior tongue that prevents rotation. Patented, rotational adjustment is provided for varying hip developments. All edges are flared to prevent irritation.

The "Hip Tracker" prevents the pelvic band from migrating into the rib cage.

Tricentric gears mimic the collapsing nature of the body.

Universal thigh cuff includes slotted posterior/anterior tongues, convertible straps for right or left hand pull, and quick release buckles.

As the hip flexes, the "Hip Tracker" creates downward forces that lock the pelvic band onto the pelvis preventing migration.

## **Features**

- Full ROM
- Abduction set at 15°
- Stainless steel gears
- Extremely low profile
- Malleable attachment extension
