

**Omar is maintaining range and independent ambulation with a diagnosis of Duchenne Muscular Dystrophy (DMD)**

Circle # 89 on Readers' Service Card

## OMAR'S PATIENT INSPIRED SOLUTION

Ultraflex stretching AFOs (worn at rest/ nighttime) are being used bilaterally to maintain and increase muscle length and improve passive range of motion. Specific to Omar's case, Ultraflex technology is being used to increase and maintain dorsiflexion ROM for continued independent ambulation. Omar has been using his Ultraflex dynamic assist stretching orthoses for over five years. During his first year of use at age eight, the family reported improvements in walking. By age 12, Omar's dorsiflexion ROM had increased significantly. Now Omar is maintaining his range, demonstrating heel-toe gait, and continues with independent ambulation.
